

GARS Case Study

**Applying an Innovative Investment
Solution to the Standard Life Staff
Pension Scheme**

Standard Life's pension problem

In 2005, the trustees of the £1 billion Standard Life Staff Pension Scheme faced a problem common to many defined benefit pension schemes. Up until then they had taken a traditional investment approach, with a high allocation to equities and a small proportion in bonds, property and private equity. However, several years of volatile markets had taken its toll and the Scheme was running an accounting deficit of around £200 million.

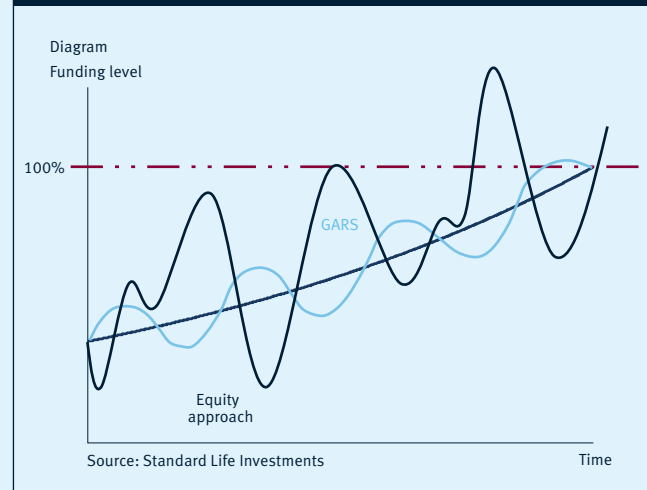

A solution was therefore required to both close the funding gap and to ensure the liabilities could be met on a more sustainable basis.

The decision-making process that followed involved several parties, each with different objectives.

- From the company's perspective, the staff pension scheme constituted a key risk to the balance sheet. Standard Life was set to demutualise and a large pension deficit could have threatened the company's ability to make dividend payments.
- The trustees' objectives centred on minimising funding risk and demonstrating a plan to close the funding gap.
- The investment manager (Standard Life Investments) was responsible for constructing and implementing a solution that could target a good return relative to liabilities but with less investment risk than the previous investment strategy that was heavily dependent on equities.
- The investment consultant was responsible for providing formal independent advice on the proposed structure.

Completely hedging all investment risks relative to liabilities was not an option – returns needed to be sufficient not only to cover the liabilities but to also improve the funding position while guarding against future market shocks. In response to the trustees' willingness to reduce risk, the company agreed to make substantial incremental payments into the Scheme. The solution would therefore need to meet future liabilities, keep contributions at a reasonable level and avoid excessive exposure to volatile asset classes.

Improving funding and reducing volatility

A practical solution

The solution proposed by Standard Life Investments marked a complete change of strategy from the traditional equity/bond approach. It involved the creation of a 'liabilities-plus' strategy, with a focus on outperforming liabilities rather than a benchmark index.

The trustees were understandably concerned about taking such a radically different approach – both in terms of where they had come from and because few pension schemes ran a similar strategy. Therefore, Standard Life Investments spent a significant amount of time working closely with the trustees explaining the strategy and its benefits in providing a smoother route to higher funding levels.

The chart shows how the strategy has subsequently performed relative to both its liabilities and the CAPS* median UK pension scheme. It can be clearly seen that the Scheme's assets have remained in touch with the liabilities, providing significant downside protection at a time when traditional risk assets performed poorly. Indeed, in 2008, when markets were particularly turbulent, the Scheme was the best performing FTSE 100 pension scheme**.

Liabilities plus strategy performance

Effective implementation

Step one — set the risk budget

For Standard Life Investments, the starting point in implementing the solution was to examine the Scheme's current position and identify the major risks (equity market, interest rate and inflation). In conjunction with the trustees, an overall investment risk budget was agreed and a target of liabilities +2.2% each year over rolling three-year periods was established, based on objective valuations and the liabilities deficit. The chart opposite shows the number of risks identified as well as the magnitude of each standalone risk factor.

Step two — reduce unrewarded risk

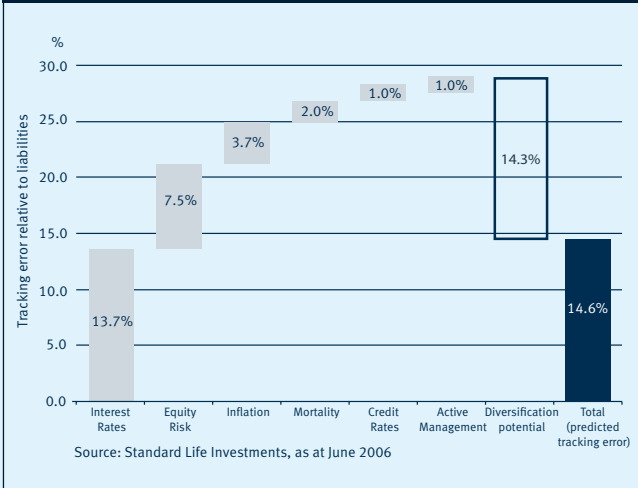

It was essential to distinguish between risks that were likely to be rewarded and those that were not. Where possible, the unrewarded risks would be removed or mitigated. Specifically, changes in interest rates and inflation, which affect the value of a pension scheme's liabilities, were considered the principal unrewarded risks.

The aim of the investment manager was to construct an asset portfolio with the same sensitivity to those factors as the liabilities. This would limit the differences between asset and liability movements, thereby reducing risk.

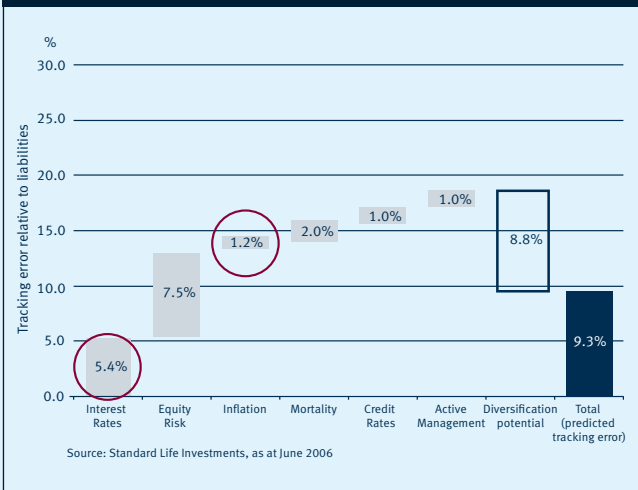

To construct this liability-hedging portfolio, the manager used a derivatives overlay to reduce the unrewarded risks. The extent of the risk reduction achieved is indicated by the numbers circled in red in the chart opposite. Interest rate risk, for example, fell from 13.7% to 5.4%.

Crucially, the trustees allowed time and flexibility to build this hedge position and, as a result, the investment manager was able to execute transactions in the most efficient manner possible.

Identify the nature and magnitude of risk

Reduce unrewarded risk

Effective implementation

Step three — address equity market risk and implement a diversified growth portfolio

The next step was to reduce equity market risk while still seeking positive returns. The aim was to not only match the assets and liabilities to reduce unrewarded risk but also to generate some investment performance. This was crucial initially, to remove the funding deficit and provide a cushion against future market shocks. Rather than rely on the vagaries of stock markets to provide the targeted return we instead devised a highly diversified multi-asset solution, which sought to deliver a targeted return, within a specified risk budget. This approach utilised both the benefits of diversification and the fundamental strengths of Standard Life Investments' skilled portfolio managers.

Called Global Absolute Return Strategies, the solution aimed to deliver consistent investment returns at low levels of volatility compared with traditional asset classes. To achieve this, it invested in a broad range of investment opportunities covering both traditional and advanced asset classes.

The initial transition phase largely involved retaining the existing physical holdings while removing market risk through derivatives. Standard Life Investments then introduced a number of strategies that would help meet the return requirements. The number circled in red in the chart opposite highlights the resultant reduction in market risk – the multi-asset strategy risk was only 2.5% compared with a 7.5% equity risk shown in the chart above.

Address equity bias risk with multi-asset strategy

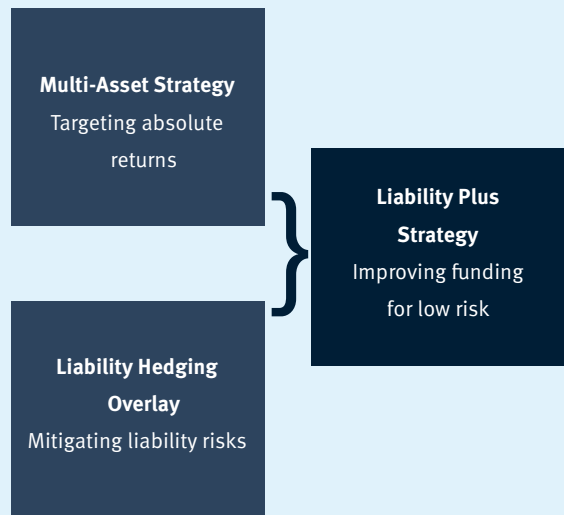

Summary

It was clear to all parties that the Scheme's assets needed to deliver consistent growth in a risk-aware way. By working closely with the trustees to understand their requirements, Standard Life Investments was able to design and implement a distinctive multi-asset approach, aimed at helping the Scheme outperform its liabilities with low levels of risk.

The decision by the Scheme's trustees to implement this radically different investment solution has provided a lower-risk framework for the Scheme to meet its funding objectives.

Today, the Scheme is fully funded and the low-risk objective has been borne out in practice (actual tracking error versus the liability benchmark has been gradually reduced over the last 10 years, from around 8% per annum to around 3% per annum). The Scheme's funding level has also shown steady, sustained improvement over the period since the strategy's inception.

This material serves to provide general information to clients and is not meant to be legal or tax advice for any particular investor, which can only be provided by qualified tax and legal counsel.

All opinions and estimates in this document are those of Standard Life Investments, and constitute Standard Life Investments' best judgment as at the date indicated. The information in this material is only as current as the date indicated, and may be superseded by subsequent market events or for other reasons. Statements concerning market trends are based on current market conditions, which may fluctuate.

An investment in any type of strategy is speculative and involves certain risks. Prospective investors should ensure that they: (1) understand the nature of the investment and the extent of their exposure to risk; (2) have sufficient knowledge, experience and access to professional advisors to make their own legal, tax, accounting, and financial evaluation of the merits and risks of participating in an investment in the strategy; and (3) consider the suitability of investing in light of their own circumstances and financial condition. No investment process is free of risk and there is no guarantee that the investment process described herein will be profitable. Investors may lose all of their investments.

Due to among other things, the volatile nature of the markets, the investment strategies discussed herein may only be suitable for certain investors.

The foregoing factors do not claim to be a complete list or explanation of the risks involved in an investment in the strategy. As the investment markets and strategy develop and change over time, an investment may be subject to additional and different risk factors. No assurance can be made that profits will be achieved or that substantial losses will not be incurred. In the U.S. risks are also described in the SLI (Corporate Funds) Limited ADV Part II and will vary depending on the type of investment.

Any benchmarks referred to are broad based indices used for comparative/illustrative purposes only and have been selected as they are well known and are easily recognizable by investors. Comparisons to benchmarks have limitations because benchmarks have volatility and other material characteristics that may differ from the portfolio. For example, investments made for the portfolio may differ significantly in terms of security holdings, industry weightings and asset allocation from those of the benchmark. Accordingly, investment results and volatility of the portfolio may differ from those of the benchmark. Also, the indices noted in this presentation are unmanaged, are not available for direct investment, and are not subject to management fees, transaction costs or other types of expenses that the portfolio may incur. In addition, the performance of the indices reflects reinvestment of dividends and, where applicable, capital gain distributions. Therefore, investors should carefully consider these limitations and differences when evaluating the comparative benchmark data performance.
